Email Settings

Email To:

Subject:

Send As HTML:

Show Errors:

The key aspects of the module's Email Settings are as follows:

1. **Email To:** One or more valid email addresses, separated by commas. The formatted response email will be sent to these addresses when the submit button is pressed.
2. **Subject:** This text will appear in the subject line of the email.
3. **Send as HTML:** When ticked your email will be formatted in html using any styling tags you have applied. When not ticked the email will be sent as plain text.
4. **Show Errors:** You may tick Show Errors during troubleshooting for a more detailed summary of an error. We will try to help if we can. Please provide all your settings details and a screenshot to support@intechrity.com.au

Please note:

- If you receive emails from a number of modules, consider adding the domain name and other distinguishing details in the Subject field.
- HTML emails are 'pretty' but it's often easier to copy/paste response data from text emails.
