SMTP Settings

Inherit From Host

Email From:

SMTP Server:

Port:

Authenticate:

Username:

Password:

Requires SSL:

The key aspects of the module's SMTP Settings are as follows:

1. **Inherit from Host:** You may already have valid email settings in your DNN host settings. If so, tick this box to use them. Otherwise please enter your full settings in the boxes provided.
2. **Email From:** This email address will appear as the sent-from email.
3. **SMTP Server:** The SMTP server used to send out the email.
4. **Port:** The port used for your outgoing email (typically 25)
5. **Authenticate:** Specify if authentication is required for the SMTP Server
6. **Username:** Authentication User name if authentication is required
7. **Password:** Authentication password if authentication is required
8. **Requires SSL:** Specify if SSL is required for the specified SMTP Server

Please note:

- This module allows the use of any valid SMTP settings. Please enter your correct settings into each field. You may experience an error if you leave a setting blank.
- You should confirm server, port and authentication details with your email service provider. You might find the settings used for your DNN Host SMTP to be a helpful guide.
- Confirm you can send an email from your email client (e.g. DNN Host, Outlook) using your settings. If they work in Outlook (or other email client) they will generally work in this module.
